## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

1. (Currently Amended) A method of enabling anonymous communication between a user and an application, via interaction of a sensing device with coded data disposed on a printed on an interactive surface to generate interaction data, the method including the steps, performed in a computer system, of:

identifying a first telecommunication address of the user from either an identity of the sensing device received or determined in the computer system of theor the interaction data generated by the sensing device via said interaction with the printed interactive surface;

associating a temporary telecommunication address with the first telecommunication address;

sending the temporary telecommunication address and interaction data to an application;

receiving information from the application addressed to said temporary telecommunication address; and

forwarding the information from the application to the first telecommunication address.

- 2. (Original) The method of claim 1, wherein the step of identifying the first telecommunication address includes determining an identity of the sensing device, and identifying the first telecommunication address from the identity.
- 3. (Original) The method of claim 1, wherein the interaction data includes a digital signature of the user and the step of identifying the first telecommunication address includes identifying the first telecommunication address recorded for a registered user identified by the digital signature.
- 4. (Original) The method of claim 1, wherein the computer system includes a first server, and the step of associating is performed at the first server.
- 5. (Original) The method of claim 4, wherein the first server is a registration server.

6. (Original) The method of claim 4, wherein the step of sending the temporary telecommunication address is performed by the first server.

7. (Original) The method of claim 1, wherein the step of associating is performed by encrypting the first telecommunication address of the user to form the temporary

telecommunication address.

8. (Original) The method of claim 7, wherein the first telecommunication address of the user is derived from the temporary telecommunication address upon receipt of the first information from the applications server by decrypting the temporary telecommunication

address to which the first information was sent.

9. (Original) The method of claim 6, wherein the temporary telecommunication address

is provided with a unique identifier.

10. (Previously Presented) The method according to claim 9, including the step,

performed by the first server, of checking the unique identifier to determine whether the first

server can forward the information from the application to the first telecommunication

address of the user.

11. (Original) The method of claim 6, wherein the association of the temporary

telecommunication address with the first telecommunication address of the user is valid for

a limited number of steps of said server forwarding the information from the application to

the first telecommunication address of the user.

12. (Previously Presented) The method of claim 1, wherein the first telecommunication

address of the user is selected from one of an email address, a web address, a facsimile

number, a telephone number, a pager, a mobile phone number, or a Personal Digital

Assistant (PDA) address.

13. (Previously Presented) The method of claim 1, wherein the temporary

telecommunication address is selected from one of an email address, a web address, a

facsimile number, a telephone number, a pager, a mobile phone number, or a PDA address.

Appln No. 10/815637 Amdt. Dated: April 24, 2008 Response to Office Action of January 24, 2008

4

14. (Original) The method of claim 12, wherein the temporary telecommunication address has the same form as the telecommunication address of the user.

15. (Original) The method of claim 1, wherein at least some of the coded data includes

an identifier.

16. (Original) The method of claim 15, wherein the identifier is a unique product item

identifier.

17. (Original) The method of claim 16, wherein the unique product item identifier is an

electronic product code.

18. (Currently Amended) A system for enabling anonymous communication between a

user and an application, via interaction of a sensing device with coded data disposed on

aprinted on an interactive surface to generate interaction data, the system including a

computer system configured and programmed to:

receive the interaction data from generated by the sensing device via said interaction

with the printed interactive surface;

identify a first telecommunication address of the user from either an identity of the

sensing device received or determined in the computer system or the interaction data;

associate a temporary telecommunication address with the first telecommunication

address;

send the temporary telecommunication address and interaction data to an

application;

receive information from the application, the information being addressed to said

temporary telecommunication address; and

forward the information from the application to the first telecommunication address.

19. (Original) The system of claim 18, wherein the computer system is configured and

programmed to identify the first telecommunication address by determining an identity of

the sensing device, and to identifying the first telecommunication address from the identity.

20. (Original) The system of claim 18, wherein the interaction data includes a digital

signature of the user and the step of identifying the first telecommunication address includes

Appln No. 10/815637 Amdt. Dated: April 24, 2008

Response to Office Action of January 24, 2008

5

identifying the first telecommunication address recorded for a registered user identified by

the digital signature.

21. (Original) The system of claim 18, wherein the computer system includes a first

server, and the step of associating is performed at the first server.

22. (Original) The system of claim 21, wherein the first server is a registration server.

23. (Original) The system of claim 21, wherein the step of sending the temporary

telecommunication address is performed by the first server.

24. (Original) The system of claim 18, wherein the step of associating is performed by

encrypting the first telecommunication address of the user to form the temporary

telecommunication address.

25. (Original) The system of claim 24, wherein the first telecommunication address of

the user is derived from the temporary telecommunication address upon receipt of the first

information from the application by decrypting the temporary telecommunication address to

which the first information was sent.

26. (Original) The system of claim 23, wherein the temporary telecommunication

address is provided with a unique identifier.

27. (Previously Presented) The system of claim 26, including the step, performed by the

server, of checking the unique identifier to determine whether the server can forward the

information from the application to the first telecommunication address of the user.

28. (Original) The system of claim 23, wherein the association of the temporary

telecommunication address with the first telecommunication address of the user is valid for

a limited number of steps of said server forwarding the information from the application to

the first telecommunication address of the user.

Appln No. 10/815637 Amdt. Dated: April 24, 2008

Response to Office Action of January 24, 2008

6

29. (Previously Presented) The system of claim 18, wherein the first telecommunication

address of the user is selected from one of an email address, a web address, a facsimile

number, a telephone number, a pager, a mobile phone number, or a PDA address.

30. (Previously Presented) The system of claim 18, wherein the temporary

telecommunication address is selected from one of an email address, a web address, a

facsimile number, a telephone number, a pager, a mobile phone number, or a PDA address.

31. (Original) The system of claim 29, wherein the temporary telecommunication

address has the same form as the telecommunication address of the user.

32. (Original) The system of claim 18, wherein at least some of the coded data includes

an identifier.

33. (Original) The system of claim 32, wherein the identifier is a unique product item

identifier.

34. (Original) The system of claim 33, wherein the unique product item identifier is an

electronic product code.

35. (Withdrawn) A method in connection with the transfer of information, including the

steps, performed in a computer system, of:

associating a user telecommunication address with a temporary telecommunication

address;

sending interaction data to an application accompanied with the temporary

telecommunication address, wherein said interaction data comprises data generated by the

sensing device following interaction of the sensing device with the coded data while the

sensing device was used to write or draw on the surface;

receiving information from said application addressed to said temporary

telecommunication address; and

forwarding, said application information to said user telecommunication address.

36. (Withdrawn) A method in connection with the transfer of information, including the

steps of:

Appln No. 10/815637

Amdt. Dated: April 24, 2008

Response to Office Action of January 24, 2008

7

associating a user telecommunication address with a temporary telecommunication

address;

sending to a service handler user unit information data accompanied with the

temporary telecommunication address, wherein said user unit information data comprise

either data resulting from what is marked on an activation icon on a position coded surface

by a user unit or data associated with a certain area of the position coded surface;

receiving at a server information from said service handler addressed to said

temporary telecommunication address; and

forwarding from said server said service handler information to said user

telecommunication address.
